The Mincon RC Story

The Mincon Group has over 26 years' experience in design and manufacture of high quality Reverse Circulation Hammers in a drilling discipline that is just over 34 years old. With a dedicated manufacturing plant equipped with state of the art equipment in Perth Australia, Mincon are located in the heart of RC Hammer development worldwide.

In 2006 Mincon commenced development on a range of next generation Reverse Circulation Hammers. Bringing our considerable experience to the new line of Hammers produced a design that is recognized globally for its performance, reliability and sample quality. The Mincon MX Range of RC Hammers are high performance geological sampling tools that provide trouble free operation in all kinds of demanding conditions.

Since their release the Mincon MX range of RC Hammers have been put to work in applications all around the world and have proven they are more than capable to the task. With a long heritage of manufacturing DTH tools that can consistently drill deeper than the competition, the Mincon MX range of RC Hammers has achieved some of the deepest holes on record, even when encountering large amounts of back pressure in the bore hole. This unique feature of Mincon Hammers allows the contractor peace of mind that no matter what they encounter they will get their hole drilled to depth.

Building on Mincon's strong heritage of design and manufacturing we commenced development on a new range of RC Hammers in 2010. The Mincon MR Range of RC Hammers offers drillers up to a 20% increase in productivity versus the Mincon MX range, a stronger shank design, improved drilling in wet holes, easier serviceability and improved life on internal and external service spares.

The MR Range of DTH Hammers

The MR range of RC hammers is designed to perform at the top end of the performance scale compared to other tools on the market. With extensive testing over the past 18 months the MR range of tools offers some very significant benefits over the MX range of RC hammers.

Performance improvements show up to 20% increase in production in both grade control and exploration applications vs. the Mincon MX range. As with all Mincon hammers the tools performed extremely well in deep hole drilling in dry applications and where there is a lot of water in the bore hole. With a variable length available on the chuck sleeve the hammer can be easily set up for either dry or wet hole drilling. Set to become the standard by which RC hammers will be measured, the Mincon MR range of tools get the job done.

Key Features and Benefits

- Patented mounting system for fixed internal components
- An extremely sturdy shank with a short length allows for greater transfer of energy between the piston and bit
- Variable chuck sleeve lengths for varying drilling conditions
- Single piece sample tube assembly
- Specially heat treated sample tubes offer superior wear resistance vs. our competition
- Variable sample tube bore sizes for the MR116, MR120 and MR132 allows the contractor greater flexibility in setting up his tool
- Metal sprayed chuck sleeve and wear sleeve options for greater wear resistance on outside circulation
- Ease of service with no special assembly or disassembly tools required
